

2025 Annual Drinking Water Quality Report

Consumer Confidence Report
COLONY AT PINEHURST WATER SYSTEM - PWS 1700858
January 1 to December 31, 2025

“Este reporte incluye informacion importante sobre el agua para tomar. Para asistencia en español, favor de llamar al telefono (281) 356-5347.”

Your drinking water meets or exceeds all federal (EPA) drinking water requirements. The U.S. Environmental Protection Agency (EPA) requires water systems to test for up to 97 contaminants. The following results list all the federally regulated or monitored contaminants which have been found in your drinking water. The analysis was made by using the data from the most recent EPA required tests and lab analysis on your water. This report is a summary of the quality of the water we provide our customers. We hope this information helps you become more knowledgeable about what’s in your drinking water.

Please see Definition/Abbreviation section for specific terms and measures explanations.

The water system’s result is highlighted in yellow.

Results

Lead and Copper Table

There were **NO Present** Lead/Copper detections in year 2025.

Coliform Bacteria Table

There were **No Present** Total or E. coli Coliform detections in year 2025.

Disinfectant Residual Table

This table shows the average, minimum and maximum levels of chlorine measured in the water system throughout the year.

| Disinfectant | Year | Average Level | Minimum Level | Maximum Level | MRDL | MRDLG | Unit of Measure | Violation (YES/NO) | Source in Drinking Water |
|--------------------------------|------|---------------|---------------|---------------|------|-------|-----------------|--------------------|--|
| Sodium Hypochlorite (Chlorine) | 2025 | 1.71 | 1.09 | 2.75 | 4 | 4 | mg/L | NO | Water additive used to control microbes. |

 January 1 to December 31, 2025

Regulated Contaminants

In the tables below, we have shown the regulated contaminants that were detected. Chemical sampling of our drinking water may not be required on an annual basis; therefore, information provided in this table refers back to the latest year of chemical sampling results.

| Inorganic Contaminants | Collection Date | Highest Level Detected | Range of Levels Detected | MCLG | MCL | Unit of Measure | Violation (YES/NO) | Likely Source of Contamination |
|--------------------------------|-----------------|------------------------|--------------------------|------|-----|-----------------|--------------------|--|
| Asbestos | 12/16/2025 | 0.45 | 0.45-0.45 | 7 | 7 | MFL | NO | Decay of asbestos cement water mains; Erosion of natural deposits |
| Barium | 12/16/2025 | 0.114 | 0.114-0.114 | 2 | 2 | ppm | NO | Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits |
| Fluoride | 12/16/2025 | <0.5 | <0.5-<0.5 | 4 | 4 | mg/L | NO | Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories. |
| Nitrate [measured as Nitrogen] | 12/16/2025 | <0.25 | <0.25-<0.25 | 10 | 10 | mg/L | NO | Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits. |

Is MY Water Safe According to the Results?

2025 Annual Drinking Water Quality Report

Consumer Confidence Report

COLONY AT PINEHURST WATER SYSTEM - PWS 1700858

January 1 to December 31, 2025

ABOUT US:

The water system is owned and operated by **Quadvest**, 40+ year-old company specializing in the operations and maintenance of water and sewer treatment and distribution systems. If you have any questions concerning water quality or the source of your water, please call our office at **(281) 356-5347**.

We do not hold regularly scheduled meetings.

HEALTH NOTE

Special Notice for the ELDERLY, INFANTS, CANCER PATIENTS, people with HIV/AIDS or other immune problems:

You may be more vulnerable than the general population to certain microbial contaminants, such as Cryptosporidium, in drinking water. Infants, some elderly, or immunocompromised persons such as those undergoing chemotherapy for cancer; persons who have undergone organ transplants; those who are undergoing treatment with steroids; and people with HIV/AIDS or other immune system disorders, can be particularly at risk from infections. You should seek advice about drinking water from your physician or health care providers. Additional guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available from the **Safe Drinking Water Hotline (800) 426-4791**.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Contaminants may be found in drinking water that may cause taste, color, or odor problems. These types of problems are not necessarily causes for health concerns. For more information on taste, odor, or color of drinking water, please contact the system's business office.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but we cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested.

Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at

<http://www.epa.gov/safewater/lead>

DEFINITIONS/ ABBREVIATIONS

Action Level: The concentration of contaminants which, if exceeded, triggers treatment or other requirements which a water system must follow.

Action Level Goal (ALG): The level of a contaminant in drinking water below which there is now known or expected risk to health. ALGs allow for a margin of safety.

Avq: Regulatory compliance with some MCLs is based on running annual average of monthly samples.

Maximum Contaminant Level or MCL: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal or MCLG: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum residual disinfectant level or MRDL: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum residual disinfectant level goal or MRDLG: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Level 1 Assessment: A study to identify potential problems and determine (if possible) why total coliform bacteria have been found in the water system.

Level 2 Assessment: A detailed study to identify potential problems and determine (if possible) why an E.coli MCL violation has occurred and/or why total coliform bacteria have been found in the water system on multiple occasions.

MFL: million fibers per liter (a measure of asbestos)

na: not applicable.

mrem: millirems per year (a measure of radiation absorbed by the body)

NTU: nephelometric turbidity units (a measure of turbidity)

pCi/L: picocuries per liter (a measure of radioactivity)

ppb: micrograms per liter or parts per billion - or one ounce in 7,350,000 gallons of water.

ppm: milligrams per liter or parts per million - or one ounce in 7,350 gallons of water.

ppq: parts per quadrillion, or picograms per liter (pg/L)

ppt: parts per trillion, or nanograms per liter (ng/L)

Treatment Technique/TT—a specific treatment method required by the EPA to control the level of contaminant in drinking water.

Secondary Constituents

Many constituents (such as calcium, sodium or iron) which are often found in drinking water can cause taste, color, and odor problems. The taste and odor constituents are called secondary constituents and are regulated by the State of Texas, not the EPA. These constituents are not causes for health concern. Therefore, secondaries are not required to be reported in this document but they greatly affect appearance and taste of your water.

2025 Annual Drinking Water Quality Report

Consumer Confidence Report

COLONY AT PINEHURST WATER SYSTEM - PWS 1700858

January 1 to December 31, 2025

Source of Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. **The presence of contaminants does not necessarily indicate that water poses a health risk.** More information about contaminants and potential health effects can be obtained by calling the **EPAs Safe Drinking Water Hotline at (800) 426-4791**.

ALL Drinking water may contain contaminants.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

Water Loss

A Water Loss Audit was submitted to the Texas Water Development Board for the 2025 calendar year. The system lost an estimated 2,842,101 gallons of water. If you have questions about water loss, please contact Quadvest at 281-356-5347.

Lead Service Line Inventory

A Lead Service Line Inventory has been prepared and submitted to TCEQ. This system contains 0 lead, 0 galvanized requiring replacement, and 0 unknown lines. To request a copy, please contact Quadvest at 281-356-5347.

Information about Source Water Assessments

No Source Water Assessment for your drinking water source(s) has been conducted by the TCEQ for your water system. The report describes the susceptibility and the types of constituents that may come into contact with the drinking water sources based on human activities and natural conditions. The information in this assessment allows us to focus our sources water protection strategies. For more information on source water assessments and protection efforts at our system, contact Quadvest @ 281-356-5347

The SWSA susceptibility ratings are divided into threedivisions: “High,” “Medium,” and “Low.”

“High” susceptibility means there are activities near the source water and the natural conditions of the aquifer or watershed make it very likely that chemical constituents may come into contact with the source water. It does **not** mean that there are any health risks present.

“Medium” susceptibility means there are activities near thesource water and the natural conditions of the aquifer or watershed make it somewhat likely that chemical constituents may come into contact with the source water. It does **not** mean that there are any health risks present.

“Low” susceptibility means there are activities near the source water and the natural conditions of the aquifer or watershed make it unlikely that chemical constituents maycome into contact with the source water. It does **not** meanthat there are any health risks present.

For more information about your sources of water, pleaserefer to the Source Water Assessment Viewer available atthe following URL:

January 1 to December 31, 2025

Source Water Information

COLONY AT PINEHURST WATER SYSTEM provides groundwater from the Gulf Coast Aquifers, located in Montgomery County, TX.

Our water source(s) and source water assessment information are listed below:

| Source Name | | Type of Water | Report Status | Location |
|------------------------|---------------------------|---------------|---------------|----------|
| 1 - HWY 249, PINEHURST | HWY 249, PINEHUR ST | Ground water | Not Completed | N/A |
